ABOUT WETZEL

Founded in 1932 in Joinville (SC), **Wetzel** is a reference in the segments in which it operates, meeting specific demands with high demand.

The company currently has more than 45,000 m² of area and has over 1,300 employees. It offers a diversified portfolio for those who need innovative and competitive solutions.

By working in partnership with its clients, it helps identify business opportunities and develops products that meet project needs and exceed expectations.

It is a dynamic organization in continuous transformation and expansion, with consolidated performance in the Brazilian market and abroad.

ALUMINUM AND IRON

In the **industrial lighting** segment, **Wetzel** is always remembered in the market for its quality, durability and efficiency. With almost 50 years of experience in the lighting market, it occupies a prominent national position and always follows the evolution of light source technologies.

Therefore, it established a specific business segment:

Wetzel EX. This segment that was born with expertise in the development of robust cast aluminum light fixtures for industrial environments. In order to provide innovative and competitive solutions, **Wetzel EX** has a trained and qualified team to develop modern and efficient products, following the high requirements of the industrial market, to meet the needs of projects and exceed customer expectations.

CONCEPTS

The presence of explosive and/or potentially explosive atmospheres is very common in the most diverse segments of industry, be it petrochemical, mining, pharmaceutical and many other sectors.

The management and control of these atmospheres is essential to maintaining the safety of these facilities and includes the use of equipment designed for use in classified areas, static control, adequate ventilation, isolation of hazardous areas, and training of personnel.

In order to guarantee the safety of these installations, it is therefore essential that the equipment is used in accordance with the classification of the areas and the flammable gases and/or dusts present in these environments.

In order to properly specify these products, it is necessary to understand some basic concepts, which are described below:

EXPLOSIVE ATMOSPHERES

Explosive atmospheres, also known as hazardous areas, are environments in which the mixture of flammable substances, such as gases, vapors, dusts, or fibers, with oxygen in the air reaches a certain concentration and can be ignited by an ignition source. These atmospheres can be extremely hazardous because ignition of the flammable materials in them can cause explosions or violent fires.

For an atmosphere to be considered explosive, three key elements must be present at the same time:

FLAMMABLE SUBSTANCE: There must be a substance or mixture of flammable substances present in the environment, such as gases, vapors, dusts or fibers.

AIR OXYGEN: Atmospheric oxygen must be present in an adequate amount to sustain combustion.

IGNITION SOURCE: An ignition source, such as electrical sparks, open flames, heat, friction, or static discharges, must be present to initiate combustion.

CONCEPTS

The expression “fire triangle” (image below) is used to illustrate the presence of these three elements for the occurrence of combustion.

It is important to note that the absence and/or extinction of any of these elements will result in the extinction of the fire.

CLASSIFIED AREAS

The classification of areas is critical to safety as it helps to identify and control the risks associated with explosive atmospheres. In Brazil, the classification of areas is done according to the international standard IEC 60079, which defines criteria for the classification of hazardous areas.

Classified areas are divided into different zones or classes, based on the probability and frequency of occurrence of an explosive atmosphere. The most common areas are:

ZONE 0 (Gas): Area where the presence of an explosive gas atmosphere is constant, persistent or for long periods of time.

ZONE 1 (Gas): Area where the presence of an explosive gas atmosphere is likely to occur under normal operating conditions.

ZONE 2 (Gas): Area where the presence of an explosive gas atmosphere is unlikely to occur under normal operating conditions, but if it does, it will be for a short period of time.

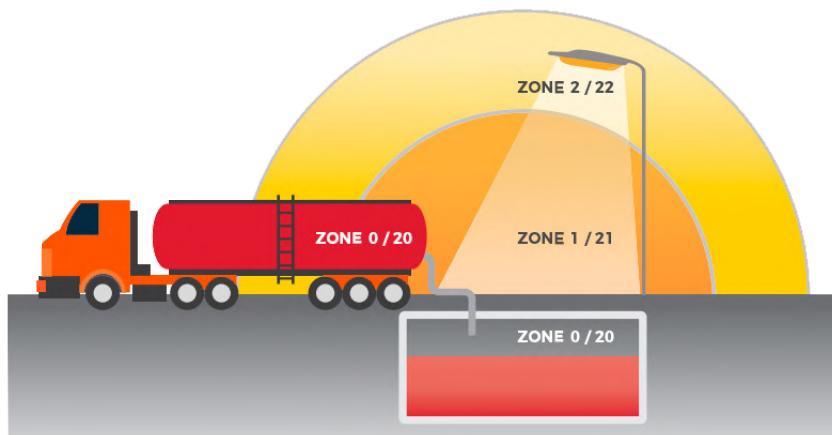

ZONE 20 (Dust): Area where the presence of an explosive dust atmosphere is constant, persistent or for long periods of time.

CONCEPTS

ZONE 21 (Dust): Area where the presence of an explosive dust atmosphere is likely to occur under normal operating conditions

ZONE 22 (Dust): Area where the presence of an explosive dust atmosphere is unlikely to occur under normal operating conditions, but if it does, it will be for a short period of time.

For correct signaling, the classified areas are identified with the marking "EX", as shown below:

MATERIAL SPECIFICATION

For the correct specification of products, in addition to the classification of areas already described above, it is necessary to know the type of flammable substance present in the environment.

This is because each combustible gas and dust has its own ignition temperature, which determines the operating limits of the equipment in these locations, as well as the group of flammable gases or combustible dusts to which it belongs.

CONCEPTS

Therefore, during normal operation and under anticipated environmental conditions, equipment installed in classified areas will not heat up to the point where an explosive atmosphere can be ignited. The classes of tempered gases and maximum surface temperatures for "EX" equipment are listed in the table below:

TEMPERATURE CLASS	IGNITION TEMPERATURE OF FLAMMABLE GASES (°C)	MAXIMUM SURFACE TEMPERATURE OF "EX" EQUIPMENT (°C)	PERMITTED TEMPERATURE CLASS OF "EX" EQUIPMENT
T1	$T \geq 450$	400	T1 - T6
T2	$300 \leq T \leq 450$	300	T2 - T6
T3	$200 \leq T < 300$	200	T3 - T6
T4	$135 \leq T < 200$	135	T4 - T6
T5	$100 \leq T < 135$	100	T5 - T6
T6	$85 \leq T < 100$	85	T6

In this way, the specification of the appropriate equipment must be carried out taking into account the classification of the area, the gas and dust present in the place, taking into account its temperature class characteristics.

ZONE	GROUP	PROTECTION LEVEL PROVIDED BY "EX" EQUIPMENT
0	Flammable gases IIA, IIB and IIC	Ga - Very high
1		Gb - High
2		Gc - Increased
20	Combustible dusts IIIA, IIIB and IIIC	Da - Very high
21		Db - High
22		Dc - Increased

It is important to note that among the essential equipment for these environments, the Wetzel EX stands out. In addition to offering a wide range of products for lighting and cable management systems, the company has a solid reputation in the market for developing and marketing products certified by internationally recognized bodies. This reinforces Wetzel EX's commitment to the quality and responsibility for which the brand is already known.

When you choose Wetzel EX products, you can be confident that they meet the stringent safety and quality requirements for use in hazardous environments, helping to protect equipment and keep operators safe.

PROTECTION RATING

The IP degree of protection (ABNT NBR IEC 60529 standard) of electrical equipment includes the design measures applied to the enclosure of the equipment to ensure protection against the ingress of dust and liquids inside. The information consists of two digits, where the first digit refers to the entry of solid objects or dust and the second digit refers to the entry of liquids inside.

THE CODE THAT DEFINES THE **IP DEGREE OF PROTECTION** IT CONSISTS OF **2 DIGITS**.

The **first digit** refers to protection against solid particles

The **second digit** refers to protection against liquids.

Note: In the industry, understanding the degree of protection becomes fundamental, as certain existing processes can result in an extremely aggressive environment (with the presence of moisture/dust). Thus, the correct specification of equipment that provides the appropriate degree of protection will result in their proper functioning and increased service life.

CONCEPTS

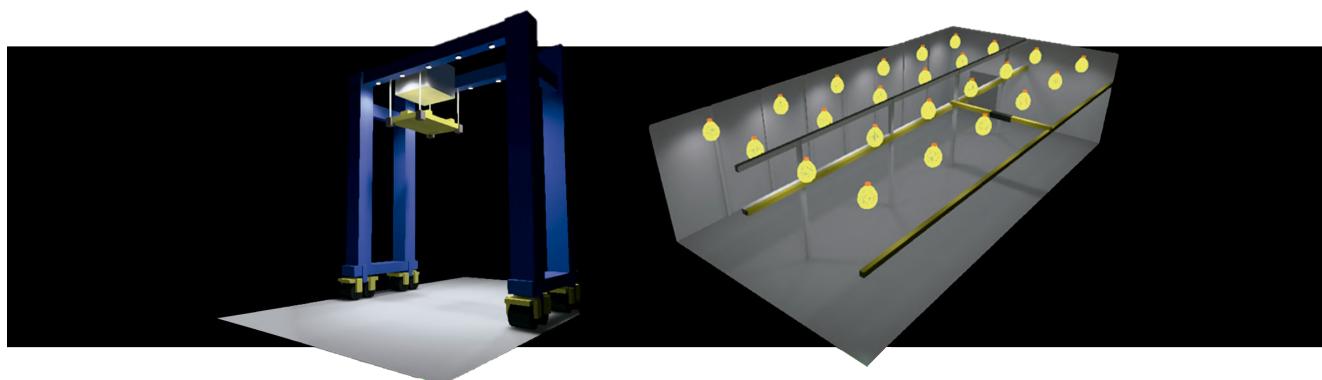

SECOND DIGIT - DEGREE OF PROTECTION AGAINST LIQUIDS

		Not protected	Protected against vertical drops of water	Protected against vertical drops of water up to a maximum slope of 15 degrees	Protected against water sprayed at an angle of ±60 degrees	Protected against water projections	Protected against water jets	Protected against powerful water jets	Protected against temporary immersion	Protected against submersion	Protected against water jets with high pressure and temperature.	
		0	1	2	3	4	5	6	7	8	9	
Not protected	0	IP00	IP01	IP02								
Protected against solid objects with Ø greater than 50mm	1	IP10	IP11	IP12								
Protected against solid objects with Ø greater than 12mm	2	IP20	IP21	IP22	IP23							
Protected against solid objects with Ø greater than 2.5mm	3	IP30	IP31	IP32	IP33	IP34						
Protected against solid objects with Ø greater than 1mm	4	IP40	IP41	IP42	IP43	IP44	IP45	IP46				
Protected against dust: 200mm water column Maximum air aspiration: 80 times the volume of the enclosure	5						IP54	IP55	IP56			
Fully protected against dust. Same test procedure	6							IP65	IP66	IP67	IP68	IP69

FIRST DIGIT - DEGREE OF PROTECTION AGAINST SOLIDS

LIGHTING PROJECT

The lighting project ensures that the entire installation of EX light fixtures is carried out through specialized analysis, generating more savings in electricity consumption and installation costs, using a model and number of ideal light fixtures for each type of application, avoiding excess or lack of light, improving efficiency in operation and making the illuminated environment more productive and safe to perform the work. Wetzel has professionals specialized in lighting for internal and external service, assisting in doubts, product specification and in carrying out projects that meet the needs of each company.

A large industrial ship, possibly an oil rig or chemical transport vessel, is shown at night. The ship's superstructure is illuminated by its own lights, casting a warm glow on the surrounding water. Several large cranes are visible on the deck, some with their booms extended. The overall atmosphere is dark and industrial.

A photograph of a factory interior. In the foreground, a worker wearing a green hard hat and dark work clothes walks away from the camera towards a bright window. The worker is positioned between two large industrial structures. The ceiling features a steel truss and several overhead lights. A prominent yellow beam above the worker has a red sign that reads "10.0 t".

A photograph of an industrial facility at night. In the foreground, there's a large, cylindrical metal tank with vertical ribbing and a walkway with railings. The background shows more industrial structures, including pipes, scaffolding, and a large cylindrical tank. The scene is illuminated by artificial lights, creating a yellowish glow.
